

getParameterNormalized

`getParameterNormalized(nameOrID)`

Description

Function to read the current value of a parameter in the normalized range from 0 to 1.0. The parameter can be determined by name or ID.

Available in: Controller, Processor.

Arguments

nameOrID	The name or ID of the parameter.	string or number
-----------------	----------------------------------	------------------

Return Values

Returns the current value of the parameter in the normalized range from 0 to 1.0 or `nil` if the parameter doesn't exist. If the parameter is not numeric, the function returns the same as [getParameter](#)

Example

```
-- print the normalized value of the parent layer's level parameter
function onLoadIntoSlot()
    print("Level = "..this.parent:getParameterNormalized("Level")) -- via name
    print("Level = "..this.parent:getParameterNormalized(38)) -- via ID
end
```
