

Templates

A template is a group of control elements that is created to be used multiple times on a macro page, each time with different property values. The HALion Basic Controls library comes with a large number of templates. Most of the templates are generic, such as knobs, sliders, and switches, and do not need any further documentation. However, some templates are more complex, prepared for specific tasks, like controlling a MIDI player module or a Step Modulator. For these templates, you will find further information in this documentation.

All templates described in this section can be found in the Basic Controls library. Additional templates for knobs, sliders, switches etc. can be found in the Additional Controls library.
