

onUnhandledEvent

onUnhandledEvent(event)

Description

This callback function is called when the script module receives an event that is not handled by the specific event callback functions, e.g., [onNote](#), [onRelease](#), [onController](#) and [onNoteExpression](#). If none of the specific callback functions are defined, onUnhandledEvent will receive all incoming events.

Available in: Processor.

Arguments

event	The Event object.	Event
-------	-----------------------------------	-----------------------

Example

```
-- print unhandled events
function onUnhandledEvent(event)
  print(event)
  postEvent(event)
end
```
