

addLayerPassword

```
addLayerPassword(pwd)
```

Description

Function that gives access to protected layers. By default, protected layers cannot be accessed by scripts. The parameters of a protected layer and any elements inside of it are hidden for scripts. This prevents someone unauthorized from parsing the **Program Tree** to retrieve hidden information. By calling this function with the correct password, the calling script can access the corresponding protected layers again.

To hide the password in addLayerPassword, you must also protect the script module. See [Managing Script Modules](#) for details.

Available in: Controller.

Arguments

pwd	The password of the protected layer(s).	string
-----	---	--------

Example

```
-- access the protected layer(s) which have the password "abc123"  
addLayerPassword("abc123")
```
